## A LEVEL <br> H2 MATHEMATICS GRAPHING TECHINIQUES

MASTERY

## CHAPTER ANALYSIS

- Sketch graphs with and without G.C.
- Conic graphs
- Parametric curves
- Transformation of graphs
- Graphical sketching is critical
- Understanding is useful in functions, differentiation, integration and their applications
- Appears every year, at least 1 question
- Typically constitutes less than $5 \%$ of final grade alone, but is commonly integrated in other chapters

GRAPHING TECHNIQUES PART I

## STANDARD GRAPHS CONICS

## Standard Graphs

## Intercepts

To find y -intercept: sub $\mathrm{x}=0$ and solve for y
To find $x$-intercept: sub $y=0$ and solve for $x$

## Stationary Points

| Stationary Point | Turning Point |  | Point of Inflection |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Maximum | Minimum |  |  |
| Shape of Curve |  |  |  |  |
| $\frac{d y}{d x}$ |  |  |  |  |
| $\frac{d^{2} y}{d x^{2}}$ | $\leq 0$ | $\geq 0$ | 0 | 0 |

## Asymptotes

> For proper function $f(x)=\frac{A(x)}{B(x)}$, vertical asymptote can be found by letting $Q(x)=0$
> For improper function $f(x)=\frac{A(x)}{B(x)}$, carry out long division to express it as $f(x)=C(x)+\frac{D(x)}{B(x)}$ where $\frac{D(x)}{B(x)}$ is a proper function. If $C(x)=c$ where $c$ is a constant, then $C(x)$ is the horizontal asymptote. If $C(x)=c x+d$, then $C(x)$ is the oblique asymptote.

## Points \& Lines of Symmetry

A graph can be symmetric to the:

## Circles

## Ellipses

| General Form |
| :---: |
| $b^{2} x^{2}+a^{2} y^{2}+c x+d y+e=0$, where $a \neq 0, b \neq 0, a \neq b$ |

No Asymptotes

$$
\begin{gathered}
\text { General Form } \\
x^{2}+y^{2}+a x+b y+c=0
\end{gathered}
$$

$$
b^{2} x^{2}+a^{2} y^{2}+c x+d y+e=0, \text { where } a \neq 0, b \neq 0, a \neq b
$$

| Standard Form |
| :---: | :---: |
| $\frac{(x-h)^{2}}{a^{2}}+\frac{(y-k)^{2}}{b^{2}}=1$ |

## Left-Right Hyperbola

Left-Right Hyperbola

Top-Bottom Hyperbola

Equation of Asymptotes:

$$
y= \pm \frac{b}{a}(x-h)+k
$$

## General Form

$$
b^{2} x^{2}-a^{2} y^{2}+c x+d y+e=0, \text { where } a \neq 0, b \neq 0
$$

## Standard Form

$$
\frac{(x-h)^{2}}{a^{2}}-\frac{(y-k)^{2}}{b^{2}}=1
$$

## Top-Bottom Hyperbola

## General Form

$$
a^{2} y^{2}-b^{2} x^{2}+c x+d y+e=0, \text { where } a \neq 0, b \neq 0
$$

## Standard Form

$$
\frac{(y-k)^{2}}{b^{2}}-\frac{(x-h)^{2}}{a^{2}}=1
$$

Rectangular Hyperbola

Horizontal Asymptote: $y=k=\frac{a}{c}$
Vertical Asymptote: $\mathrm{x}=h=-\frac{d}{c}$

## Oblique-Vertical Asymptote

Hyperbola

Oblique Asymptote: $y=s x+t$
Vertical Asymptote: $\mathrm{x}=h=-\frac{e}{d}$

## Conics - Special Hyperbolas

## Rectangular Hyperbola

## Improper Form

$$
y=\frac{a x+b}{c x+d}=\frac{\text { linear }}{\text { linear }}
$$

## Proper Form

$$
y=k+\frac{m}{x-h}, \text { where } k=\frac{a}{c} \text { and } \mathrm{h}=-\frac{d}{c}
$$

Hyperbola with an Oblique and Vertical Asymptote

| Improper Form |
| :---: |
| $y=\frac{a x^{2}+b x+c}{d x+e}=\frac{\text { quadratic }}{\text { linear }}$ |

## Proper Form

$y=s x+t+\frac{n}{x-h}$, where $\mathrm{h}=-\frac{e}{d}$

## TRANSFORMATION OF GRAPHS:

TRANSLATION SCALING \& REFLECTION
MODULUS FUNCTIONS
DERIVATIVE FUNCTIONS
RECIPROCAL FUNCTIONS

## Transformation of Graphs

Translation in the direction of an axis is to move the graph in the direction of the axis (i.e. up, down, left or right) without changing its shape or size.

| Replace $x$ with $(x-a)$ <br> $y=f(x-a)$ | Translation of $a$ units in <br> the positive $x$ direction | Graph moves right |
| :---: | :---: | :---: |
| Replace $x$ with $(x+a)$ <br> $y=f(x+a)$ | Translation of $a$ units in <br> the negative $x$ direction | Graph moves left |
| Replace $y$ with $(y-a)$ <br> $y=f(x)+a$ | Translation of $a$ units in <br> the positive $y$ direction | Graph moves up |
| Replace $y$ with $(y+a)$ <br> $y=f(x)-a$ | Translation of $a$ units in <br> the negative $y$ direction | Graph moves down |

Scaling parallel to an axis changes the size of the curve, stretching it.

| Replace $x$ with $\frac{x}{a}$ <br> $y=f\left(\frac{x}{a}\right)$ | Scaling parallel to the <br> x-axis by a factor of $a$ | Remember to change <br> the coordinates and <br> asymptotes according <br> to the new equation |
| :---: | :---: | :---: |
| Replace $y$ with $\frac{y}{a}$ <br> $y=a f(x)$ | Scaling parallel to the <br> $y$-axis by a factor of $a$ |  |

## Reflection

| Replace $x$ with $-x$ <br> $y=f(-x)$ | Reflection in the $y$-axis | Flip left/right |
| :---: | :---: | :---: |
| Replace $y$ with $-y$ <br> $y=-f(x)$ | Reflection in the x-axis | Flip up/down |

From $y=f(x)$ to $\boldsymbol{y}=|\boldsymbol{f}(\boldsymbol{x})|$
$y=f(x)$

From $y=f(x)$ to $\boldsymbol{y}=\boldsymbol{f}(|\boldsymbol{x}|)$

## Modulus Functions

To obtain graph of $\boldsymbol{y}=|\boldsymbol{f}(\boldsymbol{x})|$ from $y=f(x)$ :

1. Keep part of graph above the $x$-axis
2. Flip up (or reflect in the x-axis) the part of the graph below the $x$-axis

To obtain graph of $\boldsymbol{y}=\boldsymbol{f}(|\boldsymbol{x}|)$ from $y=f(x)$ :

1. Keep part of the graph where $x \geq 0$
2. Reflect part from (1) in the $y$-axis so the graph is symmetrical about the $y$-axis

## Derivative Functions

From $y=f(x)$ to $\boldsymbol{y}=\boldsymbol{f}^{\prime}(\boldsymbol{x})$ :

$$
\text { From } y=f(x) \text { to } \boldsymbol{y}=\boldsymbol{f}^{\prime}(\boldsymbol{x}) \text { : }
$$

$$
y=f(x) \quad y=f^{\prime}(x)
$$

| $\boldsymbol{y}=\boldsymbol{f}(\boldsymbol{x})$ | $\boldsymbol{y}=\boldsymbol{f}^{\prime}(\boldsymbol{x})$ |
| :---: | :---: |
| Stationary Point at $x=a$ | x-intercept (a, 0) |
| Strictly increasing $\left(\frac{d y}{d x}>0\right)$ | Above x-axis |
| Strictly decreasing $\left(\frac{d y}{d x}<0\right)$ | Below x-axis |
| Gradient or $\frac{d y}{d x}$ getting steeper | Graph is increasing |
| Gradient or $\frac{d y}{d x}$ getting less steep | Graph is decreasing |
| Vertical Asymptote $x=a$ | Vertical Asymptote $x=a$ |
| Horizontal Asymptote $y=a$ | Horizontal Asymptote $y=0$ |
| Oblique Asymptote $y=a x+b$ | Horizontal Asymptote $y=a$ |

## Reciprocal Functions

From $y=f(x)$ to $\boldsymbol{y}=\frac{\mathbf{1}}{\boldsymbol{f}(x)}$ :

$$
\text { From } y=f(x) \text { to } \boldsymbol{y}=\boldsymbol{f}^{\prime}(\boldsymbol{x}):
$$

| $y=f(x)$ | $y=\frac{1}{f(x)}$ |
| :---: | :---: |
| $f(x)>0$ | $\frac{1}{f(x)}>0$ |
| $f(x)<0$ | $\frac{1}{f(x)}<0$ |
| $f(x)$ increases | $\frac{1}{f(x)}$ decreases |
| $f(x)$ decreases | $\frac{1}{f(x)}$ increases |
| x-intercept ( $\mathrm{a}, 0$ ) | Vertical Asymptote at $x=a$ |
| Vertical Asymptote $x=a$ | x-intercept ( $\mathrm{a}, 0$ ) |
| Horizontal Asymptote $y=a, a \neq 0$ | Horizontal Asymptote $\mathrm{y}=\frac{1}{a}, a \neq 0$ |
| Oblique Asymptote $y=a x+b$ | Horizontal Asymptote $y=0$ |
| Maximum Point ( $\mathrm{a}, \mathrm{b}$ ), $\mathrm{b} \neq 0$ | Minimum Point ( $\mathrm{a}, \frac{1}{b}$ ), $\mathrm{b} \neq 0$ |
| Minimum Point $(a, b), b \neq 0$ | Maximum Point ( $\mathrm{a}, \frac{1}{b}$ ) , b $\neq 0$ |
| $f(x) \rightarrow \infty$ | $\frac{1}{f(x)} \rightarrow 0$ |
| $f(x) \rightarrow 0$ | $\frac{1}{f(x)} \rightarrow \infty$ |

## ' $A$ ' levels crash course program

Professionally designed crash course to help you get a condensed revision before your ' $A$ ' Levels!

The 6 hour intensive session focuses on going through key concepts and identifying commonly tested questions.
Our specialist tutors will also impart valuable exam pointers and tips to help you maximise your preparation and ace your upcoming national exam.

The crash courses will begin in June 2021 and last till Oct 2021.
